Miniclips

Light surrounds us every day - but how does it behave? Does it treat different materials the same way or differently? Find out all this and more in our new Miniclip!

Light and Shadows

This animated Miniclip examines the behaviour of light when it comes into contact with transparent, translucent, or opaque materials. Using these three types of materials, it shows why some create shadows and others don't. It also provides a brief introduction to reflection and refraction using mirrors and water.
